The Diabetes Cure: A Natural Plan That Can Slow, Stop, Even Cure Type 2 Diabetes

Synopsis

But it doesn't have to be deadly--now there is a way to halt the progression of the disease and reverse its effects. The Diabetes Cure gives you the means to cure yourself using hydroxycitric acid--an over-the-counter natural compound known as HCA. 16 million people in the United States suffer from diabetes (90 to 95 percent of these cases are type 2 diabetes). 2,200 people are diagnosed with diabetes in the United States each day, and 798,000 will be diagnosed this year. Worldwide, 120 million people suffer from diabetes--that number is expected to double over the next thirty years. Diabetes is the leading cause of new cases of blindness in people between the ages of twenty and seventy-four. Anywhere from 12,000 to 24,000 people lose their sight each year because of diabetes. Each year 56,000 amputations are performed because of nerve damage caused by the disease.

Book Information

Paperback: 288 pages

Publisher: William Morrow Paperbacks (March 22, 2000)

Language: English

ISBN-10: 006109725X

ISBN-13: 978-0061097256

Product Dimensions: 5.3 x 0.6 x 8 inches

Vern S. Cherewatenko, M.D., is a family physician in private practice and founder of HealthMax Incorporated, a company specializing in functional medicine with emphasis on diabetes, obesity, stress, nutritional biochemistry, and longevity medicine. He is cofounder of the American Association of Patients and Providers (AAPP), a nonprofit organization advocating commonsense changes in healthcare. Dr. Cherewatenko conducts community seminars nationally on female stress, diabetes, obesity, and other issues and has been featured in the Wall Street Journal, Newsweek, USA Today, and on the cover of U.S. News & World Report. He and his family live in

Renton, Washington. Paul Perry is an internationally bestselling author who has co-written nine books on near-death experiences.

Can Diabetes Be Cured? Diabetes is called the silent disease because it usually sneaks up on you without warning. It can start with feelings of overwhelming tiredness, or a need to eat even though you feel full to capacity. It sometimes shows up as blurry vision or as flashes of light. You might have a headache that lingers long past the aspirin you have taken to get rid of it, or a cut or sore that just doesn't heal. Like most people, you will ignore these early signs by blaming them on stress or too little rest. After a while, the silent disease becomes too noisy to ignore. Perhaps you lose several pounds without being on a diet, or you have a numbness or tingling in your hands that makes you fear a stroke or tumor. You know something is wrong that should be attended to by a doctor. After hearing your symptoms, the doctor suspects that you may have diabetes. Still, a diagnosis can't be made until at least a random plasma glucose test is done. This test is the simplest way to detect diabetes because it measures the amount of blood glucose in your system. It can be done without fasting to see if diabetes is possibly the problem. The nurse draws a vial of blood, and you wait for an answer from the laboratory. The results aren't good. Your doctor tells you that the normal glucose count for this test is under 200 milligrams per deciliter (mg/dl). Your numbers, he explains are over 300. "Could there be a mistake?" you ask, feeling a wave of fear. "Possibly," says the doctor. "The random plasma glucose test tells us only that you might have diabetes. The fasting plasma glucose test tells us for sure if you do." For the next eight hours you eat nothing before going back to the doctor for another blood test. "I hope it's different this time," says the nurse as she sticks the needle in your arm and draws a blood sample. The next day you are back in an examining room with your doctor. She looks at the results of the blood test and begins to interpret them for you. "In a patient without diabetes, the fasting glucose level will be less than 110 mg/dl," she says, looking down at your results. "You are substantially higher than that. I am afraid you have diabetes." A weight seems to land on your shoulders as the news settles in. Diabetes. You don't know how it happened, you don't know when it started, and chances are you don't really know exactly what it is. But you do know that you have it and that it can be bad if you don't take care of it. You think about other people in your family who have developed diabetes at your age, and you remember how they have wrestled with the problem. You might even know someone who has become seriously impaired from this silent but deadly disease. "I know this isn't good news, but millions of people have diabetes," says the doctor, trying to be reassuring. "But I don't want diabetes," you say. "Can't you cure it?" "Curing diabetes would take work on your part. Most patients

aren't willing to do what it takes to cure diabetes. On the other hand, I can treat it with drugs. The drugs I can give you will level out your blood sugar, but they won't cure diabetes, only treat it. You will have to take these drugs the rest of your life." "But I don't want to be dependent on drugs the rest of my life," you say. "I am afraid of their side effects." "All drugs have side effects," says your doctor. "But if you don't take them, you will suffer from the complications of diabetes, and those are much worse than the drugs to treat it." The prospect of having to take drugs to survive is frightening. You trust your doctor, and you know that the treatment she is offering is the same one being used for other people with diabetes. You don't want to go down that slow road of degeneration that so many other people with diabetes have followed. You want to fight against your disease, but you just don't know how. "Doctor, I am willing to do what it takes to cure my diabetes," you insist. "But tell me, can diabetes be cured?"

Battling "Syndrome X" Can Diabetes Be Cured?

I have been asked this question many times by people who are facing a lifetime of diabetes drugs. The simple answer I give is a qualified yes. Type 2, or "age onset" diabetes, is usually considered a disease of lifestyle. Unlike type 1 diabetes, which usually begins before the age of twenty when the pancreas fails to produce insulin that the body needs to process energy, type 2 diabetes generally begins after the age of thirty and is caused by weight gain and physical inactivity. The combination of these two factors makes your muscles resistant to insulin, the hormone secreted by the pancreas that converts blood sugar, or glucose, into energy. Just as gasoline must be transported into the engine of a car for combustion to take place, glucose must be transported into your muscles for energy to be created. Insulin does that transporting. If your muscles are resistant to insulin, or your pancreas isn't creating enough insulin, glucose builds up in your blood, making it a thick sludge that is hard for the heart to circulate. Blood with too much glucose clogs arteries, causing heart attacks, strokes, and a number of other very serious problems. Muscles that can't use large enough quantities of glucose waste away as nerves that don't get glucose die. The cause of insulin resistance isn't known and is called "Syndrome X," a name coined by Dr. Gerald Reaven of Stanford University.

Great book for anyone that is fighting to keep their blood sugar levels in check. I've had several friends use the product recommended with great success.

Excellent. This book is easy to read and contains common sense medical advice that embraces an integrative approach to healing. Written by an M.D., even the most conservative patient can be confident that the recommendations in this book are based on long term trials and personal case studies of the author himself, and his patients. In other words, this was not written by some New

Age guru or quack selling snake oils. Dr. Cherewatenko does not sell anything but does include a list of Consumer Reports' Top 8 glucometers in his book, as well as specific supplements by brand name that he recommends. I highly recommend this book to anyone who is interested in improving their overall health.

it is all good

The book is in very good condition and I am very happy with my order.

Type 2 diabetes runs in my family and over the years several relatives have passed away. Seeing my mother develop some of the early effects of type 2 diabetes has got my attention. After reading this very simple - straight forward book about the results of diabetes, and simple lifestyle changes the author recommends, I am focused on breaking the chain of diabetes in my family, starting TODAY. I began exercising 30 mins/day, purchased the doctors #1 recommended natural HCA supplement, and have already noticed a difference in circulation, energy, and eating habits. You owe it to yourself and your family to take the simple suggestions made by the author.

She will not look into her disease...

Good deal

great info diabetes
